

PESTICIDE INHALATION STUDY OF McFINN'S TRIPLE-FILTERED WATERPIPE

Scientifically Demonstrated to Reduce Pesticide Exposure

Filters Remove Pesticides

Scientific Inhalations partnered with the Werc Shop to test the effectiveness of McFinn's Triple-Filtered Water Pipe in reducing pesticides that may be found in the stream of medical cannabis smoke vapor.

Since cannabis products are currently grown and prepared by numerous entities that may be subject to no regulatory oversight, there is a potential risk that toxic levels of pesticide residues may be unknowingly consumed by patients. The graph shown above illustrates the relative amount of pesticide residues recovered from the smoke stream passed through a simple hand-held glass pipe and a McFinn's Triple-Filtered Waterpipe with the filter system in place, and without.

Between the different devices used, it is clearly evident that McFinn's Triple Filtered Waterpipe removed more pesticides in the smoke stream, leading to a more healthier smoke and more confidence when considering what you may or may not want to inhale with your medication.

It should be noted, while vaporizing provides a relatively healthy way to inhale, boiling point data calculations show that many deadly chemicals have vaporizing points lower than THC and CBD. Without the use of filters on these devices there is a potential to inhale with the vapor these chemicals that would be greatly reduced or eliminated with the use of the SI filtering system.
